AIR AMBULANCE CLINICAL OBJECTIVES for the OR

Clinical Objectives	Successfully Completed
Demonstrates accurate airway assessment and recognizes the need for airway intervention.	
Demonstrates accurate assessment of difficulty with providing bag mask ventilation, placement of a super-glottic airway, and placement of a surgical airway.	
Selects appropriate airway intervention and equipment for adult and paediatric patients.	
Observes and verbally identifies pertinent airway anatomy.	
Assembles equipment and medication choices and doses.	
Verbalizes indications and contraindications for paralyzing agents.	
Verbalizes appropriate sequence of administration and dosages of rapid sequence medications and possible complications.	
Verbalizes an understanding of the hazards and complications of intubation and the options available if unable to intubate a patient (BMV, bougie, video laryngoscope, super-glottic airway, surgical airway).	
Demonstrates proper techniques for airway management and maintenance, including bag-mask ventilation, and oral endotracheal intubation of adult and paediatric patients.	
Demonstrates insertion of a super-glottic device such as LMA or King-LT if available in a clinical setting.	
Demonstrates proper methods for verification of correct placement of endotracheal tube or rescue airway.	
Demonstrates proper securement of endotracheal tube or rescue airway.	
Document number of attempted/successful placements and any assistance required: • Oral ETT • Super-glottic airway
